

BEFORE YOU START USING FAUSTLIVE

STEP 1 : Configure File Associations

Why would I do that ?

To ensure that your system is well configured for .dsp, .lib and .svg files and doesn't do crazy things.

1 – Go to the folder "FilesToConfigure"

2 – For each file :

- Right Click on the file
- Choose "Open With"
- Check "Use this application for all"
- Choose the default application with which the file will be opened
(a **text editor** for .dsp and .lib ;
a **browser** for .svg)

STEP 2 : Use FaustLive

1 – Go to the folder "FaustLive"

2 – Launch the installer "setup_FaustLive"

3 – Start using it =)

RESTRICTIONS :

- 1- Remote Interfaces are not yet available on Windows
- 2- Snapshots are not archived in a .tar but only available as folders. When you recall a snapshot, you have to open the Parent Folder (ex : «MySession ») and not enter it
- 3- The compilation mode « scheduler » is not available

→ You can still install Linux ^^
